Acknowledgments, Samples, and Data

- We would like to thank Prof. Ben Armstrong from the London School of Hygiene and Tropical Medicine for providing detailed information of weather monitor data used in this article for England and Wales.
- We would like to thank the Swiss Federal Statistical Office (BFS) for providing data on the daily mortality in Switzerland used in this study.
- This work was generated using Copernicus Climate Change Service (C3S) information [1989 -2017]. The authors would like to thank the European Centre for Medium-Range Weather Forecasts (ECMWF) that implements the C3S on behalf of the European Union.
- This project has received funding from:
 The European Union's Horizon 2020 research and innovation program under the Marie
 Skłodowska-Curie grant agreement No 801076, through the SSPH+ Global PhD Fellowship
 Programme in Public Health Sciences (GlobalP3HS) of the Swiss School of Public Health

The Medical Research Council-UK (Grant ID: MR/M022625/1)

The Natural Environment Research Council UK (Grant ID: NE/R009384/1)

The European Union's Horizon 2020 Project Exhaustion (Grant ID: 820655)

The Joint Research Center of the EU (JRC/SVQ/2020/MVP/1654)

- The authors declare no conflicts of interest relevant to this study
- The data supporting the conclusions of this study can be found on the protected public repository "BORIS" of the University of Bern. The data is available after signing the data agreement and is attached in the DOI: 10.7892/boris.149875 (https://boris.unibe.ch/149875/)

Tables

- **Table S1.** Descriptive statistics of the mortality data and regional-level indicators (area, population) and characteristics of the temperature datasets (weather station, local and global gridded climate datasets (GCD)) in England and Wales (1993-2006) and Switzerland (1989-2017)
- **Table S2**. Descriptive statistics of the observed temperature by exposure dataset for the 26 regions in Switzerland, 1989 2017
- **Table S3**. Descriptive statistics of the observed temperature by exposure dataset for the 10 regions in England and Wales, 1993 2006
- **Table S4**. Relative risk (RR) for all-cause mortality (95%CI) for heat (99th percentile) by exposure dataset for Switzerland
- **Table S5**. Relative risk (RR) for all-cause mortality (95%CI) for cold (1st percentile) by exposure dataset for Switzerland
- **Table S6**. Relative risk (RR) for all-cause mortality (95%CI) for heat (99th percentile) by exposure dataset for England and Wales
- **Table S7**. Relative risk (RR) for all-cause mortality (95%CI) for cold (1st percentile) by exposure dataset for England & Wales
- **Table S8**. Goodness of fit for each exposure dataset measured by the qAIC (quasi-Akaike's information criterion) averaged over the 10 regions in England and Wales
- **Table S9**. Goodness of fit for each exposure dataset measured by the qAIC (quasi-Akaike's information criterion) averaged over the 26 regions in Switzerland
- **Table S10**. Annual excess number of deaths and mortality fractions (%) for cold ($\leq 10^{th}$, $\leq 25^{th}$ percentile) and heat ($\geq 75^{th}$ and $\geq 90^{th}$ percentile) in Switzerland between 1989 and 2017 for each exposure dataset
- **Table S11**. Annual excess number of deaths and mortality fractions (%) for cold ($\leq 10^{th}$, $\leq 25^{th}$ percentile) and heat ($\geq 75^{th}$ and $\geq 90^{th}$ percentile) in England & Wales between 1993 and 2006 for each exposure dataset
- **Table S12**. Annual number of excess deaths and mortality fractions (%) for cold, ($\leq 10^{th}$, $\leq 25^{th}$ percentile) and heat ($\geq 75^{th}$ and $\geq 90^{th}$ percentile) for the four selected regions for each exposure dataset
- **Table S13**. Summary statistics for the annual excess number of deaths, mortality fractions and associated 95% CI for heat ($\geq 90^{th}$ percentile and $\geq 75^{th}$ percentile) in Switzerland
- **Table S14**. Summary statistics for the annual excess number of deaths, mortality fractions and associated 95% CI for cold ($\leq 10^{th}$ percentile and $\leq 25^{th}$ percentile) in Switzerland
- **Table S15**. Summary statistics for the annual excess number of deaths, mortality fractions and associated 95% CI for heat ($\geq 90^{th}$ percentile and $\geq 75^{th}$ percentile) for England and Wales
- **Table S16**. Summary statistics for the annual excess number of deaths, mortality fractions and associated 95% CI for heat ($\leq 10^{th}$ percentile and $\leq 25^{th}$ percentile) for England and Wales

Missing data Switzerland

Missing data amounted to 0.09% of the days. For temperature series with one or two missing days, we used a 4-day moving average to impute the values. In the canton of Fribourg, a total of 250 days were missing for the year 2006 and we assigned the value of the corresponding TabsD-grid cell for these missing days.

Missing data England & Wales

Missing data amounted to 0.00% of the days.

GCD processing and population weighted series.

We extracted hourly (global GCD) or daily (local GCDs) mean temperatures for each grid cell for the corresponding period covering a specific region/canton. For the former, we aggregated hourly temperature observations for each region by day and created daily mean temperature averages for all grid cells throughout the regions and cantons. All cells that intersect the canton or region were included for the analysis.

We created two pairs of population-weighted and unweighted temperature series for each GCD and region. For the unweighted series (i.e. without accounting for population distribution), we estimated the average values across the cell-specific daily mean temperatures of those grid cells intersecting the boundaries of the corresponding region.

Additionally, we created a single population-weighted daily mean temperature for each region and GCD using EOSDIS gridded population data in 2000 on a 1x1 km grid resolution (UN WPP-Adjusted Population Count, v4.11 -2000) (Centre for International Earth Science Information Network - CIESIN - Columbia University. 2018). Population estimates have been created using national census and population registries based on the highest national administrative boundary available (which corresponds to the municipality level in Switzerland and Lower Super Output Areas level in the England and Wales). We summed the total population living in the region and additionally we summed the total population that residing within each grid cell using Geographic Information System methods. Then we computed the weights in each GCD-specific cell using the ratio between the population residing in the corresponding grid cell and the total population within that region. Therefore, the contribution of the grid cell towards the full time series for a region is dependent on the population residing within the grid cell relative to the overall- region specific population. Finally, we computed weighted-mean daily series for each region using mean daily temperatures of all cells in that region and the derived weights. Thus, the contribution of the cell-specific temperature data to the total region-specific daily mean temperature was dependent on population weight of the grid cell relative to the total population of a region.
